

[Esophageal radiology in the patient with dysphagia: review in 333 patients]

Abstract

The authors presents a retrospective analysis from the results of radiologic examinations in patients with dysphagia in a private clinic. They were 333 patients studied with conventional and digital radiology, using conventional technic to perform the examines. The special technique (barium/crushing-ice) was used to provoke the possible motility disorders. The results were normal in 105 patients (31.5%) and pathologic in 228 patients (68.5%).
